

RTMM - Chugach Airstrips

By
Doug Linn

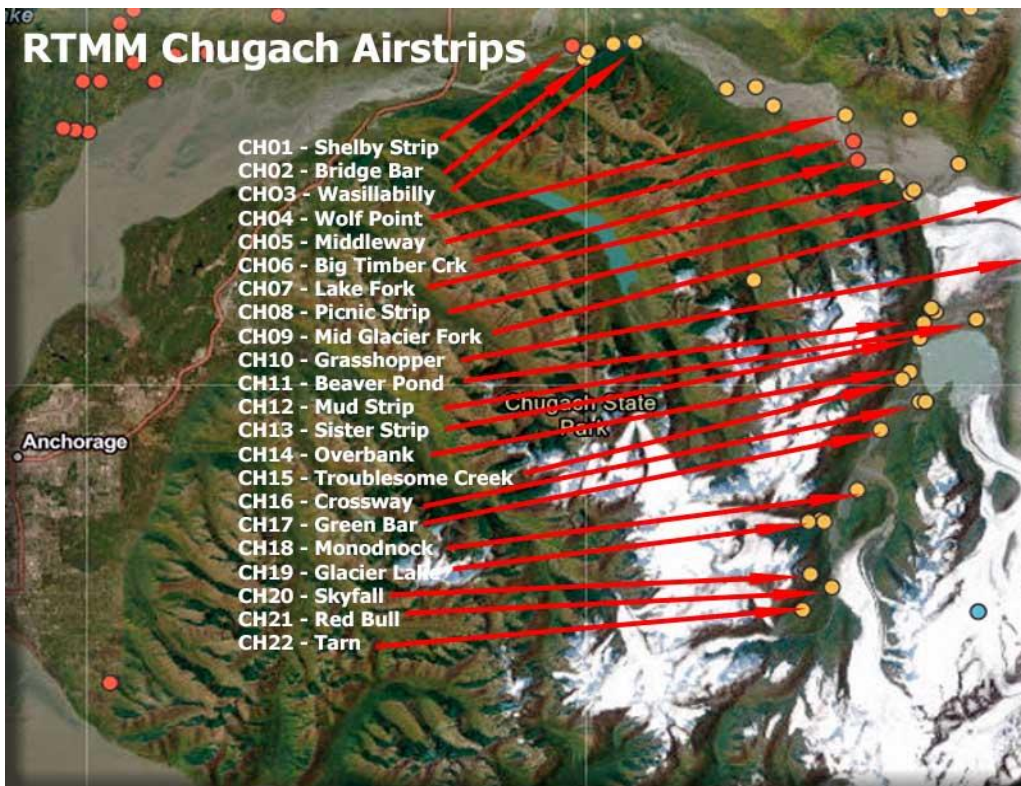

The Chugach Airstrips are all “real”. Some of them are very short (landing on sand bars, etc.). All of these are land-based and probably should be flown with a Tundra setup as none of the strips are “paved.”

The table below gives you the information you will need on the airstrips. The Lat/Long settings give you the parking place for the airstrip. Notice the “RWY Feet” ... this tells you the runway length.

NOTAM: If we could not “see” an outline of the runway, or the landmass supporting the runway, it was intentionally left out of the list.

NOTAM: In winter weather, most airstrips are covered in snow. You should use a ski rather than a tundra setup. There are runway snow markers at the sides of all runways.

NOTAM: Some airstrips were 300 feet and LESS. These are not airstrips, they are crash sites! I extended such “runways” to 500 Feet.
